

ABRAXIS KITS

The kit formats are magnetic particles (MP) (100-120 Tests), microtiter plates (P) (96 Tests), coated tubes (T) and dipstick/strips (S). All kit formats include ready-to-use reagents necessary to perform the test procedure. Total time for measurement is generally less than 60 minutes.

The sensitivity of the assays usually allows for the direct determination of the target substances in a wide range of environmental samples such as water, soil, sediment, fish tissue, and food matrices. If lower detection limits are necessary, a simple SPE concentration procedure can be used.
